

Week 6 - Functions | 12th November 2025

Problem 1: Addition Function

- Create a function that adds two numbers together and returns the result
- To test the function works, ask the user for 2 numbers, and then print the result

Example Output:

```
Enter your first number: 5
```

```
Enter your second number: 6
```

```
11
```

```
Enter your first number: 5
```

```
Enter your second number: 0
```

```
5
```

Hint - Starting Code:

```
def add(firstNumber, secondNumber):
```

```
    # your code here!
```

```
x = int(input("enter your first number: "))
```

```
y = int(input("enter your second number: "))
```

```
print(add(x,y))
```

Problem 2: isEven Function

- Create a function that checks if a number is even or odd
- The function should return True if the number is even.
- Otherwise, the function should return False
- Print “Even!” if the function output is True, and print “Odd!” if the function output is False.

Example Output:

Enter a number: 5

Odd!

Enter a number: 6

Even!

Hint:

In Python, the `%` operator returns the **remainder after division**.

For example:

`10 % 5 = 0`, because 10 divided by 5 has no remainder

`10 % 6 = 4`, because 10 divided by 6 has a remainder of 4

`10 % 7 = 3`, because 10 divided by 7 has a remainder of 3

etc...

Problem 3: String Repeater Function

- Create a function that takes two inputs: text (string) and count (integer)
- The function should return a new string that consists of the original text repeated count number of times.
- To test the function, ask the user for a word and a number, and then print the result.

Example Output:

Enter a word: Hello

Enter a number of times to repeat: 3

HelloHelloHello

Enter a word: Dog

Enter a number of times to repeat: 5

DogDogDogDogDog

Hint:

In Python, you can put two strings together using the + operator.
For example:

```
myName = "Brendan" + " McCann" # myName = "Brendan McCann"
```

Problem 4: Vowel Counter

- Create a function that takes in a string, and returns the number of vowels in the string
- To test the function, ask the user for a word, and print the result

Example Output:

```
enter a word: brendan  
Number of vowels in brendan: 2
```

```
enter a word: bob  
Number of vowels in bob: 1
```

```
enter a word: abcdefghijklmnopqrstuvwxyz  
Number of vowels in abcdefghijklmnopqrstuvwxyz: 5
```

Well done for all of your work this term, enjoy the Christmas Holidays!!!
